

Exercise

Fetch from this API endpoint: https://random-data-api.com/api/users/random_user?size=10

This will return ten random users.

Task:

1. Show each user's basic info in a card.
2. When a card is hovered upon, the card flips to show more information about the user.
3. There should also be a button that when clicked, will fetch another set of 10 random users, which updates the cards.

Here are some steps that might help to solve the exercise:

1. Fetch the data from the URL. You also have to handle converting the JSON response into a JavaScript object in this process. (See `Response.json()` resource link below)
2. Store it in React state.
3. Render the data based on the state.

Timeframe

You will have 1 week to complete this project from the time you receive this email.

Note: Use github.com and maintain the code in a well organised repository
